

Code Reference: portfolio-README.md

A source-level explanation with function details, file communication, variables, endpoints, and debugging notes.

Item	Explanation
File	portfolio-README.md
Purpose	README for the generated public portfolio website rather than the builder application.
Lines	67
Size	2,893 bytes
Talks to	public website runtime, portfolio catalog, Cloudflare/AI layer, GitHub/release layer
Functions	0
Variables/constants	0
API mentions	1
Signals	10

How this file participates in the system

This generated section reads the actual file and points out line numbers, declarations, endpoints, events, source excerpts, and debugging cues.

API endpoints mentioned or called

Item	Explanation
/api/portfolio-ai	Line 47. Handles AI assistant questions.

Important implementation signals

Item	Explanation
Cloudflare or AI at line 5	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: For the full beginner explanation of how the builder creates this website, how the files communicate, how GitHub/Cloudflare publishing works, and what each build tool does, open:
Installer at line 26	Windows setup, update, shortcut, or installation behavior. Evidence: - Installer scripts or app release artifacts.
Security or auth at line 28	Publishing protection, API key safety, HTTP security, or user authorization. Evidence: - Private credentials, tokens, or authentication cache files.
Cloudflare or AI at line 42	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: If the website uses the AI assistant, its backend belongs to the Cloudflare Worker in `cloudflare/`. That Worker is part of the website runtime. It is separate from the Windows builder application.
Cloudflare or AI at line 47	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: <meta name="portfolio-ai-endpoint" content="/api/portfolio-ai" />
Cloudflare or AI at line 50	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: For `mauriceotieno.com`, deploy the Worker from `cloudflare/` and keep DNS proxied through Cloudflare so the route `mauriceotieno.com/api/portfolio-ai` reaches the Worker. Configure the Worker secret with:
Cloudflare or AI at line 53	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: npx wrangler secret put OPENAI_API_KEY
Cloudflare or AI at line 59	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: cd cloudflare
Cloudflare or AI at line 60	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: npx wrangler deploy
Cloudflare or AI at line 63	Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: If the AI widget falls back to local/canned answers on the public site, check three things first: the meta endpoint exists in `index.html`, the Cloudflare Worker route exists for `api/portfolio-ai`, and the Worker has t

Representative opening snippet

```
1: # Portfolio Website
```

```

2:
3: This repository/folder contains the generated portfolio website files. It is the public site output, not
the Windows builder application source.
4:
5: For the full beginner explanation of how the builder creates this website, how the files communicate, how
GitHub/Cloudflare publishing works, and what each build tool does, open:
6:
7: ```text
8: docs/OMB_Portfolio_Builder_Complete_Guide.docx
9: ```
10:
11: ## What Belongs Here
12:
13: - `index.html` for the public page shell.
14: - `styles.css` for website styling.
15: - `script.js` and `electronics-search.js` for website interaction.
16: - `projects.json` for the saved public portfolio catalog.
17: - `assets/` for public images, icons, resumes, and profile media.
18: - `docs/` for public project documents and downloadable evidence.
19: - `Backgrounds/` for public background images.
20: - `CNAME` when a custom domain is configured.
21: - `robots.txt` and `sitemap.xml` for search engines.
22:
23: ## What Does Not Belong Here
24:
25: - Builder desktop app source files.
26: - Installer scripts or app release artifacts.
27: - Local draft files such as `projects.local.json`.
28: - Private credentials, tokens, or authentication cache files.
29:
30: ## Hosting
31:
32: The site is designed for static hosting such as GitHub Pages. A custom domain can be connected by placing
the domain name in `CNAME` and pointing DNS at the hosting provider.
33:
34: ## Updating Content
35:
36: The website files are generated from saved public catalog data and public assets. Edit content in the
local editing workspace, save the draft, preview the generated site, then publish the generated output into this
folder/repository.
37:
38: Manual edits inside this folder can be overwritten by the next publish. Keep lasting content changes in
the editing workspace.
39:
40: ## Portfolio AI
41:
42: If the website uses the AI assistant, its backend belongs to the Cloudflare Worker in `cloudflare/`. That
Worker is part of the website runtime. It is separate from the Windows builder application.
43:
44: The public page should include:
45:
46: ```html
47: <meta name="portfolio-ai-endpoint" content="/api/portfolio-ai" />
48: ```
49:
50: For `mauriceotieno.com`, deploy the Worker from `cloudflare/` and keep DNS proxied through Cloudflare so
the route `mauriceotieno.com/api/portfolio-ai` reaches the Worker. Configure the Worker secret with:
51:
52: ```powershell
53: npx wrangler secret put OPENAI_API_KEY
54: ```
55:
56: Then deploy:
57:
58: ```powershell
59: cd cloudflare
60: npx wrangler deploy
61: ```
62:
63: If the AI widget falls back to local/canned answers on the public site, check three things first: the
meta endpoint exists in `index.html`, the Cloudflare Worker route exists for `/api/portfolio-ai`, and the Worker
has the `OPENAI_API_KEY` secret.
64:
65: ## Public Safety
66:
67: Only public files should be stored here. Before publishing, confirm that resumes, documents, images,
project files, source links, and downloadable artifacts are intended for public viewing.

```
