

# OMB Portfolio Builder Code Reference

A generated PDF reference that explains the important source files, discovered functions, communication paths, variables, endpoints, installers, AI paths, and compiler paths.

## How Key Files Communicate

Main source file communication map.

## Frontend, Backend, Cloudflare, And Secrets

Frontend, backend, Cloudflare, and AI boundary.

## Compile Code Workspace

Compile Code workspace and simulator flow.

## Generated file index

| Item                                        | Explanation                                 |
|---------------------------------------------|---------------------------------------------|
| .github/workflows/build-windows-builder.yml | 107 lines, 0 function(s), 13 signal(s).     |

## Representative opening snippet

```
1: # Branching Workflow
2:
3: This repository uses a protected release-style workflow.
4:
5: ## Branches
6:
7: - `main` is the consumer branch. It should contain only finished, tested, release-ready code.
8: - `development` is the integration branch. It collects completed work from feature branches before
release.
9: - `feature/<short-name>` branches are used for individual app changes, experiments, fixes, or UI
improvements.
10:
11: `main` must only receive changes from `development`. Feature branches, Codex branches, hotfix branches,
and experiment branches must merge into `development` first. After `development` has collected and verified the
changes, `development` is the only branch that may be merged into `main`.
12:
13: ## Normal Change Flow
14:
15: 1. Start from the latest `development`.
16: 2. Create a focused feature branch:
17:
18: ```powershell
19: git checkout development
20: git pull origin development
21: git checkout -b feature/my-change
22: ```
23:
24: 3. Update the branch register in `README.md` with the new branch name, purpose, source branch, merge
target, and status.
25: 4. Make and test the change.
26: 5. Commit and push the feature branch:
27:
28: ```powershell
29: git add .
```

```
30: git commit -m "Describe the change"
31: git push -u origin feature/my-change
32: ``
33:
34: 6. Merge or pull-request the feature branch into `development`.
35: 7. Update the branch register status when the branch is merged, closed, or released.
36: 8. Test `development`.
37: 9. Before merging `development` into `main`, bump `package.json` to the next release version.
38: 10. Merge `development` into `main` only when the app is ready for consumers. No other source branch
should target `main`.
39: 11. Push `main` to build and publish the `builder-v<version>` release automatically, or create a release
tag from `main`, for example `builder-v<next-version>`.
40:
41: ## Branch Register Rule
42:
43: The README is the human-facing branch register. Every new branch should have a row in `README.md` before
the branch is pushed. This keeps local users, GitHub visitors, and future Codex sessions aligned on what each
branch is for.
44:
45: ## Release Rule
46:
47: Do not make app changes directly on `main`. `main` should move only after `development` has collected and
verified the changes.
48:
49: Pull requests into `main` must use `development` as the source branch. The repository includes
`.github/workflows/main-branch-gate.yml`, which fails pull requests into `main` from any other branch. GitHub
branch protection should also be enabled for `main` so direct pushes are blocked and release changes go through
the development-to-main pull request path.
50:
51: Installed apps detect updates by comparing their current app version with the latest GitHub Release
version. A `main` push must therefore carry a new `package.json` version. The release workflow rejects a `main`
push if the matching `builder-v<version>` tag already exists.
52:
53: ## Current Practice
54:
55: For Codex-assisted work, new app changes should be made on a focused `codex/...` or `feature/...` branch,
merged into `development`, and only then released through `development` into `main`.
```

Evidence: <a href="https://github.com/otienomaurence/omb-portfolio-builder/releases/latest">https://github.com/otienomaurence/omb-portfolio-builder/releases/latest</a>                                                                                     |
| Installer at line 29        | Windows setup, update, shortcut, or installation behavior. Evidence: - `OMB-Portfolio-Builder-Setup-latest-x64.exe` for the Windows installer.                                                                                                                                                                      |
| Installer at line 32        | Windows setup, update, shortcut, or installation behavior. Evidence: The normal installer default is a per-user AppData location:                                                                                                                                                                                   |
| Installer at line 35        | Windows setup, update, shortcut, or installation behavior. Evidence: C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder                                                                                                                                                                                    |
| Installer at line 41        | Windows setup, update, shortcut, or installation behavior. Evidence: C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder\OMB Portfolio Builder.exe                                                                                                                                                          |
| Installer at line 44        | Windows setup, update, shortcut, or installation behavior. Evidence: The installer uses a Windows wizard with Back, Next, Cancel, progress, and Finish. It can create Desktop and Start Menu shortcuts, and it writes a normal Windows uninstall entry. The default per-user install does not wri                   |
| Git command at line 46      | Repository state, publishing, branch checks, or release automation. Evidence: Installed users do not need Node.js or pnpm. The packaged desktop app includes its runtime. Git for Windows with Git Credential Manager is needed only for publishing to a Git repository. If Git or Git Credential Manager           |
| Installer at line 50        | Windows setup, update, shortcut, or installation behavior. Evidence: The app checks GitHub Releases for newer builder versions. When a newer release exists, the app shows an update dialog. Choosing <b>**Update**</b> downloads the installer, closes the running builder, updates the existing instal            |
| Network request at line 57  | Frontend-backend communication or public web/API calls. Evidence: <a href="https://github.com/otienomaurence/omb-portfolio-builder/releases">https://github.com/otienomaurence/omb-portfolio-builder/releases</a>                                                                                                   |
| Installer at line 62        | Windows setup, update, shortcut, or installation behavior. Evidence: On Windows, the app keeps application files and editable content under AppData:                                                                                                                                                                |
| Installer at line 64        | Windows setup, update, shortcut, or installation behavior. Evidence: - `C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder` stores the installed desktop application.                                                                                                                                      |
| Installer at line 65        | Windows setup, update, shortcut, or installation behavior. Evidence: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\builder` stores the builder workspace, local drafts, uploaded files, templates, previews, and editing tools.                                                                             |

| Item                              | Explanation                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Git command at line 66            | Repository state, publishing, branch checks, or release automation. Evidence: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\portfolio` stores the publish mirror used by Git-based publishing.                                                                                                                                   |
| Installer at line 67              | Windows setup, update, shortcut, or installation behavior. Evidence: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\compile-code` stores project compile-workspace source files and run folders created by the Compile Code tool.                                                                                                 |
| Installer at line 69              | Windows setup, update, shortcut, or installation behavior. Evidence: The installer and updater treat the AppData builder and portfolio folders as managed workspaces, not duplicate app installs.                                                                                                                                        |
| Security or auth at line 71       | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: The builder works offline for editing, project creation, file attachment, local previews, and draft saves. Publishing requires network access and repository write permission.                                                                    |
| Rich text at line 86              | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence: Project and portfolio-area overview editors support rich text editing with selection-level formatting, links, images, formulas, syntax-highlighted code blocks, hard line breaks, copy, paste, cut, and select all.                                 |
| Rich text at line 88              | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence: Front-page, profile, contact, fun facts, and project overview fields use the same selection-level text behavior: highlight the exact words to edit, then use the right-click menu or floating selection inspector to change                         |
| Compiler or simulator at line 90  | Part of the Compile Code workspace or language/tool detection. Evidence: Code support is available from the rich editor right-click menu. Use <b>Code block</b> or <b>Paste as code</b> for C, C++, SystemVerilog, LTspice, Java, JavaScript, Python, and HTML. Code blocks store the selected language, pr                              |
| Compiler or simulator at line 92  | Part of the Compile Code workspace or language/tool detection. Evidence: Projects also include a separate <b>Compile Code</b> workspace. This is local builder tooling, not a portfolio text block. Each project behaves like a small IDE workspace: the left explorer lists the source files, the main                                  |
| Compiler or simulator at line 94  | Part of the Compile Code workspace or language/tool detection. Evidence: The Compile Code workspace has separate <b>Compile</b> , <b>Build project</b> , and <b>Run</b> controls. Verilog/SystemVerilog also show <b>Simulate</b> and <b>Show scope</b> . Compile checks or builds the active source. Build project use                  |
| Compiler or simulator at line 98  | Part of the Compile Code workspace or language/tool detection. Evidence: Verilog and SystemVerilog simulation requires a testbench. Mark HDL files as <b>Design</b> or <b>Testbench</b> , or use <b>Add testbench</b> to create a starter bench with <code>\$dumpfile</code> and <code>\$dumpvars</code> . HDL Compile can syntax-check/ |
| Compiler or simulator at line 106 | Part of the Compile Code workspace or language/tool detection. Evidence: For example, a SystemVerilog file attached to a design section might be saved as <code>docs\laser-link\design\filter.sv</code> . The upload status in the builder shows the generated relative path after a file is saved.                                      |
| Rich text at line 112             | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence: Dark mode applies to builder panels, dialogs, guide windows, menus, status chips, and window/icon controls. Editing fields and selected project appearances keep their own colors so typed content, field formatting, and pr                        |
| Git command at line 116           | Repository state, publishing, branch checks, or release automation. Evidence: Publishing is controlled by Git repository write access. The builder does not embed owner passwords or private credentials.                                                                                                                                |
| Git command at line 124           | Repository state, publishing, branch checks, or release automation. Evidence: <a href="https://github.com/YOUR-USERNAME/YOUR-USERNAME.github.io.git">https://github.com/YOUR-USERNAME/YOUR-USERNAME.github.io.git</a>                                                                                                                    |
| Security or auth at line 127      | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: 3. Click <b>Authenticate target</b> .                                                                                                                                                                                                             |
| Git command at line 128           | Repository state, publishing, branch checks, or release automation. Evidence: 4. Complete GitHub/Git Credential Manager sign-in if prompted.                                                                                                                                                                                             |
| Security or auth at line 132      | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: Successful authorization is cached locally per repository and branch for about one day. If the same target receives more than three successful authorizations in one week, the local trust window can extend to 30 days for                       |
| Git command at line 136           | Repository state, publishing, branch checks, or release automation. Evidence: Install Git for Windows, Node.js, and npm. Then run:                                                                                                                                                                                                       |
| Git command at line 139           | Repository state, publishing, branch checks, or release automation. Evidence: git clone <a href="https://github.com/otienomaurice/omb-portfolio-builder.git">https://github.com/otienomaurice/omb-portfolio-builder.git</a>                                                                                                              |
| Installer at line 156             | Windows setup, update, shortcut, or installation behavior. Evidence: npm run installer                                                                                                                                                                                                                                                   |
| Installer at line 168             | Windows setup, update, shortcut, or installation behavior. Evidence: When <code>main</code> receives a release-ready version, GitHub Actions builds the Windows installer and portable executable, creates or updates the <code>builder-v&lt;version&gt;</code> GitHub Release, and uploads stable <code>latest</code> asset names.      |
| Installer at line 186             | Windows setup, update, shortcut, or installation behavior. Evidence:   <code>main</code>   Consumer/release branch for finished installer and public app code.   Initial repository branch   None   Release-ready only                                                                                                                   |
| Rich text at line 192             | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence:   <code>codex/manual-update-categories-preview</code>   Adds manual update checks, custom project categories, link-safe rich paste handling, project-only website previews, broad duplicate-install detection, and a main release workf             |

| Item                         | Explanation                                                                                                                                                                                                                                                                                                          |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Security or auth at line 193 | Publishing protection, API key safety, HTTP security, or user authorization. Evidence:   `codex/fix-publish-target-auth`   Makes publishing target setup authenticate before saving, resolves the target default branch before access checks, and blocks known local builder workspaces during installation.   `dev` |
| Security or auth at line 194 | Publishing protection, API key safety, HTTP security, or user authorization. Evidence:   `codex/cache-daily-auth-and-restore-profile`   Adds daily and extended publishing authorization caching, clarifies publishing target fields, keeps active-machine profile fields populated, and enforces development-only   |
| Installer at line 195        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/automatic-installer-update-flow`   Makes the update popup run the installer automatically, strengthens existing-install detection, and publishes stable latest installer asset names for downloads.   `development`                    |
| Installer at line 196        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/split-builder-portfolio-workspaces`   Separates local builder files from publish-mirror files, syncs publish-safe assets, and bumps the next installer release version.   `development`   `development`   Active                       |
| Installer at line 197        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/guard-latest-builder-download`   Keeps the stable latest installer asset URL aligned with release assets.   `development`   `development`   Active                                                                                     |
| Security or auth at line 198 | Publishing protection, API key safety, HTTP security, or user authorization. Evidence:   `codex/secure-builder-editor-shell`   Adds native desktop menus, light app chrome, scoped publishing authorization cache, and smoother rich-editor copy, paste, cut, and image placement behavior.   `development`   `dev`  |
| Installer at line 200        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/local-desktop-shortcut`   Forces installer-created shortcuts onto the physical Windows desktop instead of redirected OneDrive Desktop folders.   `development`   `development`   Active                                                |
| Installer at line 204        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/fix-update-auto-restart`   Makes the app update flow quit the desktop app cleanly, run the installer, and relaunch the updated executable automatically.   `development`   `development`   Merged into `development`                   |
| Installer at line 205        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/fix-update-launch-handoff`   Launches the updater through a detached Windows command handoff so the installer/relaunch script survives app shutdown.   `development`   `development`   Merged into `development`                       |
| Rich text at line 208        | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence:   `codex/fix-editor-installer-update-flow`   Fixes rich-editor context menus, prevents pasted links from rendering as formulas, adds safe fullscreen exit behavior, and lets installers update in place when old uninstaller    |
| Installer at line 212        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/skip-old-uninstaller-on-update`   Prevents in-app silent updates from launching stale uninstallers and adds an updater timeout for hung installers.   `development`   `development`   Active                                           |
| Security or auth at line 214 | Publishing protection, API key safety, HTTP security, or user authorization. Evidence:   `codex/security-and-context-menu-reporting`   Improves text-field context menus, adds builder security/download reporting, and prepares publishable website security headers.   `development`   `development`   Active      |
| Rich text at line 215        | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence:   `codex/uniform-rich-text-controls`   Makes right-click text formatting consistent for front-page, profile, and contact fields, persists field styles into previews and published portfolios, and expands common color choi    |
| Security or auth at line 216 | Publishing protection, API key safety, HTTP security, or user authorization. Evidence:   `codex/code-block-preferences`   Adds code-block authoring with syntax highlighting, source/basic paste modes, parser rendering, and builder Preferences for light/dark mode.   `codex/rich-profile-frontpage-editors`   `` |
| Rich text at line 217        | Rich editor behavior, formatting, paste handling, or content sanitization. Evidence:   `codex/full-builder-dark-mode`   Expands builder dark mode across panels, dialogs, menus, status chips, and icon controls while preserving input-field colors and project appearance templates.   `codex/code-block-prefer    |
| Cloudflare or AI at line 218 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence:   `codex/per-user-update-migration`   Moves the installer/update model to the current user's app location and prefers per-user install records over stale machine-wide records.   `codex/full-builder-dark-mode`   `developm  |
| Installer at line 219        | Windows setup, update, shortcut, or installation behavior. Evidence:   `codex/appdata-workspace-root`   Standardizes future installs and managed builder/portfolio workspaces under AppData and migrates legacy OMB app-folder installs forward.   `codex/per-user-update-migration`   `developme                    |
| Installer at line 220        | Windows setup, update, shortcut, or installation behavior. Evidence: ## Uninstall                                                                                                                                                                                                                                     |
| Git command at line 238           | Repository state, publishing, branch checks, or release automation. Evidence: Uninstall from Windows **Installed apps** / **Apps & features**. The uninstaller removes OMB Portfolio Builder, its shortcuts, and local app data when Windows requests app-data cleanup. It does not silently remove shared            |

## Representative opening snippet

```

1: # OMB Portfolio Builder
2:
3: OMB Portfolio Builder is a Windows desktop application for creating, editing, previewing, and publishing
a portfolio site from a local workspace. A fresh install starts blank: users add their own profile, sections,
projects, files, images, links, resumes, appearance choices, and publishing target.
4:
5: This README is for the builder application only. Website-specific content, domain notes, public page
layout, and generated portfolio assets belong in the portfolio site's own README.
6:
7: ## Complete Beginner Guide
8:
9: A long beginner-oriented Word guide and a deeper source-code reference are included at:
10:
11: ```text
12: docs/OMB_Portfolio_Builder_Complete_Guide.docx
13: docs/OMB_Portfolio_Builder_Code_Reference.docx
14: docs/OMB_Portfolio_Builder_Code_Reference.pdf
15: ```
16:
17: It explains the high-level design, generated block diagrams, software-engineering decisions, shell
commands, programming syntax, how the important files communicate, what each build tool owns, GitHub workflows,
Electron, the installer, caching, API endpoints, data contracts, frontend/backend/AI/Cloudflare layers, the
website, the parser, publishing, compiler tools, generated function inventories, and file-by-file repository
notes. The generator also writes source-focused Word documents to `docs/code-reference-docx` and PDF documents
to `docs/code-reference-pdf`.
18:
19: ## Install
20:
21: Download the latest Windows installer or portable executable from:
22:
23: ```text
24: https://github.com/otienomaurice/omb-portfolio-builder/releases/latest
25: ```
26:
27: Use:
28:
29: - `OMB-Portfolio-Builder-Setup-latest-x64.exe` for the Windows installer.
30: - `OMB-Portfolio-Builder-Portable-latest-x64.exe` when you want to run without installing.
31:
32: The normal installer default is a per-user AppData location:
33:
34: ```text
35: C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder

```

36: ````  
37:  
38: The installed application executable is:  
39:  
40: ````text  
41: C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder\OMB Portfolio Builder.exe  
42: ````  
43:  
44: The installer uses a Windows wizard with Back, Next, Cancel, progress, and Finish. It can create Desktop and Start Menu shortcuts, and it writes a normal Windows uninstall entry. The default per-user install does not write into `C:\Program Files`, so normal app updates can run without a Windows administrator prompt.  
45:  
46: Installed users do not need Node.js or pnpm. The packaged desktop app includes its runtime. Git for Windows with Git Credential Manager is needed only for publishing to a Git repository. If Git or Git Credential Manager is missing, setup can install Git for Windows; compatible existing tools are skipped rather than removed.  
47:  
48: ## Updates  
49:  
50: The app checks GitHub Releases for newer builder versions. When a newer release exists, the app shows an update dialog. Choosing **Update** downloads the installer, closes the running builder, updates the existing installation in place, and reopens the updated app.  
51:  
52: Setup treats an existing install as an update target, not a second installation. It checks the current user's install first, then legacy machine-wide records, uses the detected install location for updates, avoids creating duplicate builder copies, and stops when the installed version is already current or newer.  
53:  
54: Older releases remain available at:  
55:  
56: ````text  
57: <https://github.com/otienomaurice/omb-portfolio-builder/releases>  
58: ````  
59:  
60: ## Local Workspaces  
61:  
62: On Windows, the app keeps application files and editable content under AppData:  
63:  
64: - `C:\Users\<you>\AppData\Local\Programs\OMB Portfolio Builder` stores the installed desktop application.  
65: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\builder` stores the builder workspace, local drafts, uploaded files, templates, previews, and editing tools.  
66: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\portfolio` stores the publish mirror used by Git-based publishing.  
67: - `C:\Users\<you>\AppData\Local\OMB Portfolio Builder\compile-code` stores project compile-workspace source files and run folders created by the Compile Code tool.  
68:  
69: The installer and updater treat the AppData builder and portfolio folders as managed workspaces, not duplicate app installs.  
70:  
71: The builder works offline for editing, project creation, file attachment, local previews, and draft saves. Publishing requires network access and repository write permission.  
72:

```

1: // JavaScript source code
2: (() => {
3:     "use strict";
4:
5:     /**
6:      * Extend the portfolio builder with rich description editors for custom
7:      * sections and subsections. This patch adds a new rich editor to the
8:      * pending editor for custom items so that images, formulas and other
9:      * formatted content can be used in overviews of future sections. It
10:     * hooks into existing helper functions such as `populateRichEditor`
11:     * and `saveRichEditorToProject` by overriding them at runtime. To
12:     * avoid interfering with built-in behaviour, everything is wrapped
13:     * inside an IIFE and existing functions are stored before being
14:     * redefined. If a function is not present in the current context
15:     * (because the builder script changed), the patch simply does
16:     * nothing.
17:     */

| Cloudflare or AI at line 21 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: `wrangler.toml` routes `/api/portfolio-ai` on `mauriceotieno.com` and `www.mauriceotieno.com` to this Worker.                                                                                                                |
| Cloudflare or AI at line 23 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: ## Cloudflare Requirements                                                                                                                                                                                                   |
| Cloudflare or AI at line 25 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: 1. The domain must be active in Cloudflare.                                                                                                                                                                                  |
| Cloudflare or AI at line 26 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: 2. DNS for `mauriceotieno.com` / `www` must be proxied through Cloudflare, not DNS-only, for Worker routes to run.                                                                                                           |
| Cloudflare or AI at line 27 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: 3. The Worker must have the `AI` binding enabled. This repo's `wrangler.toml` includes it.                                                                                                                                   |
| Cloudflare or AI at line 28 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: 4. Optional: add the `OPENAI_API_KEY` secret if you want the Worker to use OpenAI instead of Workers AI.                                                                                                                     |
| Cloudflare or AI at line 32 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: <meta name="portfolio-ai-endpoint" content="/api/portfolio-ai" />                                                                                                                                                            |

| Item                        | Explanation                                                                                                                                                                                             |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Cloudflare or AI at line 41 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: -Uri "https://mauriceotieno.com/api/portfolio-ai" `                                                              |
| Cloudflare or AI at line 47 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: Expected result: JSON with an `answer` field and a `provider` field such as `cloudflare-workers-ai` or `openai`. |

## Representative opening snippet

```

1: # Portfolio AI Cloudflare Worker
2:
3: This Worker powers the public website endpoint:
4:
5: ```text
6: https://mauriceotieno.com/api/portfolio-ai
7: ```
8:
9: The static GitHub Pages site cannot safely hold API keys. The browser sends portfolio context to this
Worker. The Worker uses OpenAI when `OPENAI_API_KEY` is configured, and otherwise falls back to Cloudflare
Workers AI.
10:
11: ## Deploy
12:
13: From this `cloudflare` folder:
14:
15: ```powershell
16: npx wrangler login
17: npx wrangler secret put OPENAI_API_KEY # optional, Workers AI works without it
18: npx wrangler deploy
19: ```
20:
21: `wrangler.toml` routes `/api/portfolio-ai` on `mauriceotieno.com` and `www.mauriceotieno.com` to this
Worker.
22:
23: ## Cloudflare Requirements
24:
25: 1. The domain must be active in Cloudflare.
26: 2. DNS for `mauriceotieno.com` / `www` must be proxied through Cloudflare, not DNS-only, for Worker
routes to run.
27: 3. The Worker must have the `AI` binding enabled. This repo's `wrangler.toml` includes it.
28: 4. Optional: add the `OPENAI_API_KEY` secret if you want the Worker to use OpenAI instead of Workers AI.
29: 5. Keep the website meta tag:
30:
31: ```html
32: <meta name="portfolio-ai-endpoint" content="/api/portfolio-ai" />
33: ```
34:
35: ## Test
36:
37: After deployment:
38:
39: ```powershell
40: Invoke-RestMethod `
41:   -Uri "https://mauriceotieno.com/api/portfolio-ai" `
42:   -Method Post `
43:   -ContentType "application/json" `
44:   -Body '{"question":"Hi","context":{"profile":{"displayName":"Maurice Otieno}}}'
45: ```
46:
47: Expected result: JSON with an `answer` field and a `provider` field such as `cloudflare-workers-ai` or
`openai`.

```

## Representative opening snippet

```
1: OMB Portfolio Builder installation notes
2:
3: This installer includes the desktop application, the local portfolio builder, the local preview server,
```

the website template files, and the Electron runtime needed to run the app.

4:

5: The app does not require the user to install Node.js or npm. Those are development/build tools only.

6:

7: The installer creates a desktop shortcut by default. Untick the shortcut option during setup if you do not want one.

8:

9: By default, setup installs for the current Windows user at %LOCALAPPDATA%\Programs\OMB Portfolio Builder. The builder workspace and publish mirror live under %LOCALAPPDATA%\OMB Portfolio Builder, so editable builder files and generated portfolio output stay together in AppData. This avoids protected Program Files updates and lets the app update itself without needing an administrator prompt for normal releases.

10:

11: If OMB Portfolio Builder is already installed through Windows, setup tells the user which version it found, checks the current user's installation before legacy machine-wide records, pins setup to that current installed location, asks for approval during normal interactive installs, and updates that copy. Setup will not create a second installed copy in a different folder. During an in-app Update action, setup runs silently after the user clicks Update and updates the existing installation in place without running the old uninstaller first or requiring the user to manually uninstall first.

12:

13: Setup also scans fixed drives for other OMB Portfolio Builder executables, portable copies, and local desktop-builder workspaces. It treats %LOCALAPPDATA%\OMB Portfolio Builder\builder and %LOCALAPPDATA%\OMB Portfolio Builder\portfolio as managed app workspaces, not duplicate installs. If it finds another unregistered copy, setup stops and asks the user to remove, uninstall, or rename that copy first. This prevents duplicate builders from leaving one machine with stale editing features.

14:

15: Publishing to GitHub Pages requires Git for Windows with Git Credential Manager. During setup, the installer can check publishing tools and install Git for Windows if Git or Git Credential Manager is missing. If compatible tools already exist, setup skips them. Existing shared tools are not silently removed.

16:

17: For GitHub authentication, open Publishing target inside the app, enter the target repository, then click Save target and authenticate. A GitHub/Git Credential Manager sign-in flow may open in the browser. The builder keeps the previous target until GitHub verifies write access to the new target. After authentication succeeds, click Load from target to refresh from that repository.

18:

19: Successful publishing authorization is cached locally for about one day for the selected repository and branch.

20:

21: Older and newer installers remain available from the GitHub Releases page.

22:

23: Fresh installs start blank. No personal projects, resumes, profile photos, custom domains, or portfolio sections are included until the user adds them or authenticates to load a compatible publishing target.

| Cloudflare or AI at line 63 | Public AI assistant, Worker deployment, or model-provider fallback behavior. Evidence: If the AI widget falls back to local/canned answers on the public site, check three things first: the meta endpoint exists in `index.html`, the Cloudflare Worker route exists for `/api/portfolio-ai`, and the Worker has t |

## Representative opening snippet

```
1: # Portfolio Website
2:
3: This repository/folder contains the generated portfolio website files. It is the public site output, not
the Windows builder application source.
```

```

4:
5: For the full beginner explanation of how the builder creates this website, how the files communicate, how
GitHub/Cloudflare publishing works, and what each build tool does, open:
6:
7: ```text
8: docs/OMB_Portfolio_Builder_Complete_Guide.docx
9: ```
10:
11: ## What Belongs Here
12:
13: - `index.html` for the public page shell.
14: - `styles.css` for website styling.
15: - `script.js` and `electronics-search.js` for website interaction.
16: - `projects.json` for the saved public portfolio catalog.
17: - `assets/` for public images, icons, resumes, and profile media.
18: - `docs/` for public project documents and downloadable evidence.
19: - `Backgrounds/` for public background images.
20: - `CNAME` when a custom domain is configured.
21: - `robots.txt` and `sitemap.xml` for search engines.
22:
23: ## What Does Not Belong Here
24:
25: - Builder desktop app source files.
26: - Installer scripts or app release artifacts.
27: - Local draft files such as `projects.local.json`.
28: - Private credentials, tokens, or authentication cache files.
29:
30: ## Hosting
31:
32: The site is designed for static hosting such as GitHub Pages. A custom domain can be connected by placing
the domain name in `CNAME` and pointing DNS at the hosting provider.
33:
34: ## Updating Content
35:
36: The website files are generated from saved public catalog data and public assets. Edit content in the
local editing workspace, save the draft, preview the generated site, then publish the generated output into this
folder/repository.
37:
38: Manual edits inside this folder can be overwritten by the next publish. Keep lasting content changes in
the editing workspace.
39:
40: ## Portfolio AI
41:
42: If the website uses the AI assistant, its backend belongs to the Cloudflare Worker in `cloudflare/`. That
Worker is part of the website runtime. It is separate from the Windows builder application.
43:
44: The public page should include:
45:
46: ```html
47: <meta name="portfolio-ai-endpoint" content="/api/portfolio-ai" />
48: ```
49:
50: For `mauriceotieno.com`, deploy the Worker from `cloudflare/` and keep DNS proxied through Cloudflare so
the route `mauriceotieno.com/api/portfolio-ai` reaches the Worker. Configure the Worker secret with:
51:
52: ```powershell
53: npx wrangler secret put OPENAI_API_KEY
54: ```
55:
56: Then deploy:
57:
58: ```powershell
59: cd cloudflare
60: npx wrangler deploy
61: ```
62:
63: If the AI widget falls back to local/canned answers on the public site, check three things first: the
meta endpoint exists in `index.html`, the Cloudflare Worker route exists for `/api/portfolio-ai`, and the Worker
has the `OPENAI_API_KEY` secret.
64:
65: ## Public Safety
66:
67: Only public files should be stored here. Before publishing, confirm that resumes, documents, images,
project files, source links, and downloadable artifacts are intended for public viewing.

```

## Function-by-function detail

### *normalize - lines 132-134*

| Item               | Explanation                                                                                                                                                                                           |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source location    | Lines 132-134 (3 source lines).                                                                                                                                                                       |
| Purpose            | Validates or normalizes input so later code receives safe predictable values.                                                                                                                         |
| Declaration        | <code>function normalize(value) {</code>                                                                                                                                                              |
| Touches            | <code>filesystem</code>                                                                                                                                                                               |
| Calls detected     | <code>toLowerCase</code>                                                                                                                                                                              |
| API endpoints      | None detected inside this function body.                                                                                                                                                              |
| Storage keys       | No local/session storage keys detected.                                                                                                                                                               |
| Async/return clues | 0 await expression(s), 1 return statement(s).                                                                                                                                                         |
| Debug approach     | Trigger the user action that reaches this function, inspect inputs/state before the function, then inspect the returned value, DOM update, file write, process output, or API response after it runs. |

Source excerpt:

```
132: function normalize(value) {
```

```

133:   return String(value || "").toLowerCase();
134: }

```

## How this file participates in the system

This generated section reads the actual file and points out line numbers, declarations, endpoints, events, source excerpts, and debugging cues.

## Imports, requires, and external dependencies

| Item   | Explanation                                                                                                         |
|--------|---------------------------------------------------------------------------------------------------------------------|
| Line 1 | import { createServer } from "node:http";                                                                           |
| Line 2 | import { execFile, spawn } from "node:child_process";                                                               |
| Line 3 | import { createHash } from "node:crypto";                                                                           |
| Line 4 | import { access as fsAccess, chmod, cp, mkdir, mkdtemp, readFile, readdir, rm, writeFile } from "node:fs/promises"; |
| Line 5 | import os from "node:os";                                                                                           |
| Line 6 | import path from "node:path";                                                                                       |
| Line 7 | import { promisify } from "node:util";                                                                              |
| Line 8 | import { fileURLToPath } from "node:url";                                                                           |

## API endpoints mentioned or called

| Item                    | Explanation                                                                   |
|-------------------------|-------------------------------------------------------------------------------|
| /api/catalog            | Line 3343. Loads project/catalog data for the builder.                        |
| /api/templates          | Line 3353. Loads appearance template definitions.                             |
| /api/publish-target     | Line 3358. Reads or writes the Git publishing target and authorization state. |
| /api/system-check       | Line 3367. Checks local tool/system readiness.                                |
| /api/app-update         | Line 3372. Checks or starts builder app update behavior.                      |
| /api/security-report    | Line 3377. Returns security/download/auth reporting for the builder.          |
| /api/code/tools         | Line 3386. Checks compiler/runtime availability.                              |
| /api/portfolio-ai       | Line 3402. Handles AI assistant questions.                                    |
| /api/code/beautify      | Line 3407. Formats source code for cleaner display and editing.               |
| /api/code/save          | Line 3422. Saves source code into the local compile workspace.                |
| /api/code/compile       | Line 3433. Compiles or runs a source file and returns terminal output.        |
| /api/code/install-tools | Line 3444. Attempts to install missing compiler tools.                        |

| Item                          | Explanation                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------|
| /api/publish-target           | Line 3455. Reads or writes the Git publishing target and authorization state.                               |
| /api/install-git              | Line 3465. Project-specific local API endpoint. Inspect server.mjs and the fetch caller for exact behavior. |
| /api/app-update/install       | Line 3479. Checks or starts builder app update behavior.                                                    |
| /api/github-authenticate      | Line 3493. Project-specific local API endpoint. Inspect server.mjs and the fetch caller for exact behavior. |
| /api/sync-from-publish-target | Line 3510. Reads or writes the Git publishing target and authorization state.                               |
| /api/save-draft               | Line 3525. Project-specific local API endpoint. Inspect server.mjs and the fetch caller for exact behavior. |
| /api/apply-catalog            | Line 3525. Loads project/catalog data for the builder.                                                      |
| /api/apply-catalog            | Line 3534. Loads project/catalog data for the builder.                                                      |
| /api/upload                   | Line 3577. Project-specific local API endpoint. Inspect server.mjs and the fetch caller for exact behavior. |

## Important implementation signals

| Item                            | Explanation                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Compiler or simulator at line 1 | Part of the Compile Code workspace or language/tool detection. Evidence: import { createServer } from "node:http";                                                                                                         |
| Process execution at line 2     | Runs Git, compilers, installers, or helper tools outside the JavaScript runtime. Evidence: import { execFile, spawn } from "node:child_process";                                                                           |
| Compiler or simulator at line 3 | Part of the Compile Code workspace or language/tool detection. Evidence: import { createHash } from "node:crypto";                                                                                                         |
| File read at line 4             | Reads local builder state, project files, website assets, or configuration. Evidence: import { access as fsAccess, chmod, cp, mkdir, mkdtemp, readFile, readdir, rm, writeFile } from "node:fs/promises";                  |
| Compiler or simulator at line 5 | Part of the Compile Code workspace or language/tool detection. Evidence: import os from "node:os";                                                                                                                         |
| Compiler or simulator at line 6 | Part of the Compile Code workspace or language/tool detection. Evidence: import path from "node:path";                                                                                                                     |
| Compiler or simulator at line 7 | Part of the Compile Code workspace or language/tool detection. Evidence: import { promisify } from "node:util";                                                                                                            |
| Compiler or simulator at line 8 | Part of the Compile Code workspace or language/tool detection. Evidence: import { fileURLToPath } from "node:url";                                                                                                         |
| Process execution at line 15    | Runs Git, compilers, installers, or helper tools outside the JavaScript runtime. Evidence: const execFileAsync = promisify(execFile);                                                                                      |
| File read at line 16            | Reads local builder state, project files, website assets, or configuration. Evidence: const packageJson = JSON.parse(await readFile(path.join(root, "package.json"), "utf8").catch(() => "{}"));                           |
| Browser DOM at line 34          | Builder or website interface behavior in the browser/Electron renderer. Evidence: ".xlsx": "application/vnd.openxmlformats-officedocument.spreadsheetml.sheet",                                                            |
| Security or auth at line 40     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: const publishAuthCachePath = path.join(root, ".omb-publish-session.json");                                                          |
| Security or auth at line 51     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: "_headers",                                                                                                                         |
| Security or auth at line 57     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: const publishAuthCacheTtlMs = 24 * 60 * 60 * 1000;                                                                                  |
| Security or auth at line 58     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: const publishAuthExtendedTtlMs = 30 * 24 * 60 * 60 * 1000;                                                                          |
| Security or auth at line 59     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: const publishAuthHistoryWindowMs = 7 * 24 * 60 * 60 * 1000;                                                                         |
| Security or auth at line 60     | Publishing protection, API key safety, HTTP security, or user authorization. Evidence: const publishAuthExtendedThreshold = 3;                                                                                             |

| Item               | Explanation                                                            |
|--------------------|------------------------------------------------------------------------|
| Source location    | Lines 2375-2403 (29 source lines).                                     |
| Purpose            | Part of publishing, Git, target repository, or authorization behavior. |
| Declaration        | async function capturePublishTargetState() {                           |
| Touches            | filesystem                                                             |
| Calls detected     | runPublishGit, trim, readFile, resolveInsidePortfolioRoot              |
| API endpoints      | None detected inside this function body.                               |
| Storage keys       | No local/session storage keys detected.                                |
| Async/return clues | 3 await expression(s), 1 return statement(s).                          |

| Item           | Explanation                                                                                                                                                                                           |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Debug approach | Trigger the user action that reaches this function, inspect inputs/state before the function, then inspect the returned value, DOM update, file write, process output, or API response after it runs. |
